MATHEMATICS M2 Mechanics 2

A.M. MONDAY, 2 June 2008 $1\frac{1}{2}$ hours

ADDITIONAL MATERIALS

In addition to this examination paper, you will need:

- a 12 page answer book;
- a Formula Booklet;
- a calculator.

INSTRUCTIONS TO CANDIDATES

Answer all questions.

Sufficient working must be shown to demonstrate the **mathematical** method employed.

Take g as 9.8 ms⁻².

INFORMATION FOR CANDIDATES

The number of marks is given in brackets at the end of each question or part-question.

You are reminded of the necessity for good English and orderly presentation in your answers.

- 1. An elastic string, of natural length 0.3 m, supports a weight of 12 N hanging freely in equilibrium. The total length of the string is 0.55 m.
 - (a) Calculate the modulus of elasticity of the string. [3]
 - (b) Find the elastic energy stored in the string. [3]
- 2. The engine of a vehicle, of mass 900 kg, is working at a constant rate of 32 kW. The vehicle maintains a steady speed of 16 ms^{-1} up a hill which is inclined at an angle α to the horizontal, where $\sin \alpha = \frac{8}{49}$. Calculate the resistive force acting on the vehicle. [4]
- 3. A particle, of mass 5 kg, moves in a straight line under the action of a single force whose magnitude FN at time ts is given by

$$F = 15t^2 - 60t, \qquad t \ge 0.$$

- (a) Find the acceleration of the particle when t = 2.
- (b) The velocity of the particle at time t s is denoted by $v \text{ ms}^{-1}$. Given that v = 35 when t = 0, find an expression for v in terms of t. [4]

[2]

- (c) Calculate the least value of the speed of the particle. [3]
- (d) Determine the distance travelled by the particle between t = 2 and t = 8. [4]
- 4. In an event in the Winter Olympic Games, a competitor pushes a sled for a short time, then jumps onto the sled at a point A when the sled has a speed of 2 ms^{-1} and rides the sled downhill on a curved track. The altitude at A is 2232 m, the altitude at the finish is 2128 m and the length of the track from A to the finish is 1335 m. The competitor has a mass of 50 kg and her sled is of mass 40 kg. Her speed at the finish is 35 ms^{-1} .
 - (a) Calculate the work done against the resistance to motion from A to the finish. [6]
 - (b) Assuming the resistance is constant, calculate its magnitude. [2]
- 5. A particle is projected from point A on the horizontal ground such that its initial horizontal velocity is 12 ms^{-1} and its initial vertical velocity is 14 ms^{-1} . After it reaches its highest point and it is on its way down, it just clears a wall, which is 8.4 m high.
 - (a) Find the horizontal distance of the wall from the point A. [6]
 - (b) Find the speed and direction of motion of the particle as it clears the wall. [7]

- 6. A constant force $\mathbf{F} = \mathbf{i} 4\mathbf{j} + \mathbf{k}$ acts on a bead as it moves along a straight smooth wire from point *A* to point *B*. Point *A* has position vector $2\mathbf{i} + \mathbf{j} + \mathbf{k}$ and point *B* has position vector $3\mathbf{i} \mathbf{j} + 2\mathbf{k}$. Find
 - (a) the vector \mathbf{AB} , [2]
 - (b) the work done by the force \mathbf{F} .
- 7. (a) A vehicle moves with velocity $\mathbf{v} = \sin(3t)\mathbf{i} + 2\cos(5t)\mathbf{j} + 3t^3\mathbf{k}$ at time t. Find an expression for the acceleration of the vehicle at time t. [3]
 - (b) Two vehicles A and B move on the same horizontal plane. At time t, A is at position $(-8t 2)\mathbf{i} + (3t + 3)\mathbf{j}$ and B is at position $(-16t + 11)\mathbf{i} + (9t 8)\mathbf{j}$. Determine the value of t when the distance between A and B is least, and calculate this distance. [7]
- 8. A particle P, of mass 4 kg, is tied to one end of a light inextensible string and the other end of the string is fastened to a fixed point O. The particle P moves with a uniform speed of 2 ms^{-1} in a

horizontal circle with centre A and radius $\frac{3}{7}$ m, as shown in the diagram.

(<i>a</i>)	Find the size of AOP .	[6]

- (b) Calculate the tension in the string. [1]
- (c) Determine the length of the string. [1]

TURN OVER

[3]

9. A ball, of mass 2 kg, is attached to one end of a light inextensible string of length 0.5 m. The other end of the string is attached to a fixed point *O*. Initially, the ball is held at rest at a point *A* such that *OA* is inclined at an angle of 60° to the downward vertical through *O*, as shown in the diagram.

The ball is projected downwards from A with velocity 4 ms^{-1} perpendicular to OA so that it starts describing a vertical circle centre O. When the string is inclined at an angle θ to the downward vertical, the speed of the ball is $v \text{ ms}^{-1}$.

(a) Show that $v^2 = 9 \cdot 8\cos\theta + 11 \cdot 1.$ [4]

[4]

(b) Find, in terms of θ , the tension in the string.
